### Sprint 3 velocity: 34

In sprint 3, we completed 7 user stories with a total of 34 story points

#### Comments:

- This velocity (34 story points) the team has in sprint 3 would be maintained for sprint 4, because when we went over it in sprint 2 (42 story points) we were unable to finish some subtasks.
- The increase in velocity on July 14 was because we noticed that we needed a prior function to implement an already assigned user story. So, we created another user story for that function. That's why AG-86 was added on July 14.
- More user stories in sprint 3 got completed on the final day due to some integration issues – frontend and backend integration.

#### Takeaways:

- Going forward, we hope to finish frontend and backend at least 3 days before to leave time for integration.
- To ensure we have a more accurate burndown chart, we aim to update the status on JIRA as frequently as possible, ideally every day.
- In terms of sprint 4 planning, we plan not to go over 34 story points for sprint 4. However, if we finish the assigned user stories and we have extra time, we will add more user stories into sprint 4.
